The topic and title of the article are very interesting and necessary in the field of disaster risk reduction. It is clear that integrating mental health support into disaster risk reduction strategies is a necessity in today's society, and this need was strongly felt during the COVID-19 crisis.

The article has effectively demonstrated the importance and urgency of this need and has provided a good historical background on the topic in the United States. However, several fundamental issues can be observed in the article:

1) the article's objective is not clearly stated, 2) the type of research is not specified, 3) the target population is not defined, 4) the article lacks a materials and methods section, as well as a results section, 5) the article does not have a limitations section, and finally, the article does not follow an academic format. If these sections are added to the article, it may be accepted as a scholarly article.
