Title of the manuscript: **The Effect of Group-Based Family Orientation to Community**

Mental Health Services.

I would like to thank you for addressing an interesting topic. Here are few of my comments for authors.

1. Abstract; Vey short, study design and the types of analysis used in the paper was not mentioned
2. Introduction: Should begin by discussing about community mental health service So this part needs revision. The operational definitions of some terms were written in introduction part. Hence they should be separated by title.
3. Method:
 - what are your inclusion and exclusion criteria?
 - You used natural quasi experimental design. How did you control for confounding factors as there were no randomizations of participants in this study design?
 - The type of analysis used in this paper is not clear?
4. Discussion
 - Your discussion is shallow.
 - The last paragraph should be separated and considered as Conclusion and Recommendation.

With Regards,
