The case report provides valuable clinical information regarding the treatment of a serious side effect caused by medication.

For potential publication, I believe the most important question to address initially is why the angioedema was attributed to ramipril rather than amlodipine. There is abundant literature reporting this side effect associated with amlodipine, which I consider to be the primary concern.

On the other hand, once the previous question has been resolved, I believe that the writing, explanation, presentation, and depth of the report could be substantially improved. Additionally, it is necessary to include a discussion based on the literature regarding the cause, mechanism, and treatment of this side effect.

In conclusion, it is imperative to clarify the underlying cause of angioedema. Once this is addressed, focus on enhancing the clarity of language and delving deeper into the contextual and scientific discussion.
