Potential competing interests: No potential competing interests to declare.

The Commentary proposes some considerations regarding the relationship between subjectivity and objectivity in Biological Sciences. The apparent contradiction between universality and personalization is a very current theme, which also involves the perspective of personalized medicine. The article is, therefore, a stimulus to reflect on some aspects of biology, which can also offer value from a research point of view. In particular, in the medical world, the contradiction is even stronger, because Medicine is the only science that has a subject as its object, that is, man.
