The paper looks good, and the dockings carried out were wonderful for the reader to understand. Can accept with minor corrections.

1. Abstract can be improved and interpreted with more significant results.
2. Chosen compound has been synthesised or purchased. Also, is it an organic or inorganic compound?
3. Explain the importance of docking analysis.
4. In the molecular docking section, mention the docking procedure to find the suitable target protein. How the suitable proteins are correctly docked with ligands can be justified.
5. In the abstract, expand the abbreviations.
6. Check grammar errors throughout the manuscript and avoid typo errors.
7. Software was not cited properly. Authors should check the references. Were they in journal format?
