Potential competing interests: No potential competing interests to declare.

1. The article is good, but for a literature review, it should be formed into a table so that the method, year, advantages, and disadvantages/limitations of previous research can be clearly seen.
2. This article offers a strong concept, but evidence of the implementation of a real blockchain-based payment system has not been presented. The author only proposes an adaptation of the Bojjagani, et al. architecture, without supporting experimental or simulation results. However, there has been no evaluation of the performance of the proposed model.
