Potential competing interests: interesting work

In this work, you have studied how space-time should reconcile the presentism of quantum mechanics with the eternalism of general relativity, through a model that preserves both the creativity of time and the presence of the future. This model explains phenomena like intuition or serendipity, which would result from the necessity to switch timelines in the present in order to adapt to changes in the future.

I suggest some minor changes to be done in this paper

1. Need to check language and grammatical mistakes, since there are many, so one has to correct it thoroughly.
2. Requires some analytical data for the justification of statements.
3. Could not understand the terms related to multiverse frozen space-time.

Please correct those points.
