The article does not follow the standard format for presenting a research work. One critical part of any research work is the literature review that is totally missing. None of the claimed objectives have any supportive evidence in the main body of the paper. The parameters selected for the survey and the reason for that selection, the survey result, the econometric tools used for analysis - nothing is found in the paper. The article also lacks any creative contribution to the existing knowledge. The script could at most be called a project report with relevant data/statistics missing.

The conclusions drawn also do not have any grounds, for example, what impact a 0.76kW power generation system bring when it is fed to 40 houses, while one house gets only 190 Watts electricity on the average?
