Dear authors

I have gone through this review, and the work seems fine. However, with regard to content, some changes need to be made in some paragraphs.

I have added my comments in a Word file for further revision and improvement, but to summarize,

In this review, the researchers addressed general information about aluminum and did not mention the amount of toxic concentrations or the amount of beneficial concentrations

I also suggest including some studies that dealt with the most important aluminum-resistant and sensitive plants.

The researchers also summarized the treatment methods, which are the most important in this review, with a few lines. Accordingly, I suggest adding some modern references about treatment methods and reducing their effect.
