Potential competing interests: No potential competing interests to declare.

The paper aims at investigating the number of papers published per week on interventions targeting behavioral health aspects. It is written clearly, concisely, and in a way that allows for replications to be conducted. While the results are interesting figures to present at roundtable discussion, the direction of this research for the scientific progress remains unclear. I suggest, the paper should elaborate on important implications and discuss in detail how the publication industry and scientific publishing should evolve based on the insights.
