Type II mixed cryoglobulinemia

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Type II mixed cryoglobulinemia. ORPHA:93554*

Type II mixed cryoglobulinemia, a relatively rare clinico-serological subtype of mixed cryoglobulinemia (MC, see this term), is an immune complex disorder characterized by purpura, weakness and arthralgia and defined immunochemically by cryoglobulins composed of polyclonal IgGs (autoantigens) and monoclonal IgM (autoantibody).
