**Potential competing interests:** No potential competing interests to declare.

The review covers succinctly many important topics on consciousness and is accompanied by the author's interpretation.

The author acknowledges himself the vastness of the argument and is sensitive in stating that this is yet a developing field. By offering his perspective, I believe it might fuel discussions between experts in the fields rather than aiding approaching newcomers.

As a personal suggestion, since the author included the topic of the evolution of consciousness, I encourage the mention of theories suggesting that consciousness (or more precisely, consciousness-like attributes) might have evolved from single cells and can be also present in aneural systems.
