Potential competing interests: No potential competing interests to declare.

This article provides a perspective on the evolutionary dynamics of cancer, emphasizing the ecological and evolutionary principles underlying tumor development and metastasis. I have some suggestions on this article.

1. The paper could benefit from a clearer introduction that outlines the main objectives, hypotheses, and significance of the study.
2. Providing citations for specific claims and findings would strengthen the credibility of the paper.
3. The paper could expand on the implications of its findings and discuss potential future directions for research in more detail.
4. If applicable, including details about the methodologies used in the studies referenced in the paper. This could involve describing experimental procedures, data collection methods, and statistical analyses employed in relevant research.
