**Potential competing interests:** No potential competing interests to declare.

This is one very nice research paper.

It consists of an Abstract and 5 sections:

1. Introduction (with 4 subsections)
2. Theoretical Framework (with 5 subsections)
3. Materials and Methods (with 3 subsections)
4. Findings and Discussions (with 5 subsections)
5. Conclusion

Everything is followed by a relevant list of references, with enough new references.

The paper is well constructed, the topic is interesting, and the results are relevant. It is obvious that the authors are experienced in writing such articles.

I really think that this research paper will open a wide range of new potential research questions and that it will be interesting for QEIOS readers.

Compliments to the authors.

I only miss a few things in this paper: numbers and visual presentation of some data. Not necessary... but more as a suggestion.
