Review of: "Knowledge among Health care workers (HCWs) regarding biomedical waste management (BMW) during COVID-19 Pandemic"

Sarah Michaud

Potential competing interests: No potential competing interests to declare.

Negative points:

1. Much more details should be added to this work:

- the country, city must be clearly specified at least in the objective,
- the period of collect is not written,
- the sociodemographic data are not presented,
- access to the questionnaire is important in supplementary material,
- readers have no idea of the questions asked in the questionnaire in order to measure knowledge;
- discussion: very poor

2. Abbreviations should be re-worked; more keywords; at least 20 references must be provided

3. Graphics and tables:

- Some tables could me merge to better the understanding,
- mean knowledge scores should be more precised (knowledge on what exactly?)

Positive points:

This article is about an original and interesting theme. Indeed BMW is an actual problem across the world and we are still

learning about it and especially during the COVID-19 pandemic. Thiis draft should be revised in order to be published.
