MLL/GPHN Fusion Gene

National Cancer Institute

Source

National Cancer Institute. <u>MLL/GPHN Fusion Gene</u>. NCI Thesaurus. Code C99331.

A fusion gene that results from a chromosomal translocation t(11;14)(q23;q24) which fuses exon 8 of the MLL gene to the 3' half of the GPHN gene. This rearrangement is associated with treatment-related acute undifferentiated leukemia.
