Review of: "Populating Dark Sectors with Relativistic Bubble Walls"

Benoit Laurent¹

1. McGill University, Canada

This work represents an excellent review of the production of dark matter by relativistic bubbles. It presents an original mechanism to produce DM introduced by the author with concrete examples. The main ideas are clearly explained, with just enough detail to provide a good understanding of the important concepts, without going in depth into the cumbersome calculations. For readers who would like more details, the author presents a comprehensive list of references to pursue their study further.
