Potential competing interests: No potential competing interests to declare.

A good work. However, most of the figures should include schematics of the working principles rather than unexplainable hardware components. If the authors are able to do this, I recommend it for publication.

For instance, pictures of individual components (Figures 5 to 15, 18, and 19) are not necessary; it is better to have a schematic of how they interact to form the robust irrigation system.

Figures 3 and 4 are not clear! The picture quality is poor, and the parts making up each hardware structure should be labelled.

Good luck to the authors.
