Dear editor

I have read the manuscript entitled: "Cadmium Toxicity-Induced Changes in Antioxidative Enzyme Levels in Freshwater Catfish *Channa Punctatus* (Bloch)",

Although this issue is one of the most important global issues, many studies have been conducted in this regard. However, before publishing this work, the following points should be applied to the manuscript and some parts of the MS should be substantially edited.

In the abstract, the quantitative results of the research should be stated.

At the end of the introduction section, the existing scientific gap can be stated.

In the results section,

It is not necessary to express the results twice in two different forms of tables and figures. The results can only be presented in the form of graphs with significant letters.

The discussion section is too long.

General content and sentences can be deleted.

Considering that the studies of the effects of cadmium on many organisms, it is not necessary to mention other metals.

The use of a number of new references is suggested.

There are some spelling mistakes in the text that need to be corrected.

With respect
