Review of: "Zero-Divisor Graphs of $\mathbb{Z}$_n, their products and D_n"

Gete Umbrey[1]

1 Rajiv Gandhi University

I wanted to express my appreciation for the author's dedicated research in exploring the intricate world of zero divisor graphs. Particularly, the last section provided intriguing insights into the relationship between girth, prime factorization, and graph properties. The discussion on girth's connection to the number of distinct prime factors added depth to the topic. While I found the content complex, it's clear that the author has invested significant effort into this mathematical exploration.
