The review should begin with "Sources of aluminum contamination in soil." In particular, what are the natural inputs, and how do industrial and agricultural practices lead to an excess of this contamination in the ecosystem? From my perspective, the health risks could come later without needing to be separated into a new, different paragraph. I believe it is appropriate to delve deeper into each theme as it is a review, enriching the bibliography accordingly. Furthermore, in "Future Outlook," I would also suggest updating remediation methods to include the latest advances in approaches.
