Spectinomycin Sulfate

National Cancer Institute

Source

National Cancer Institute. *Spectinomycin Sulfate*. NCI Thesaurus. Code C90691.

The sulfate salt form of spectinomycin, an aminocyclitol aminoglycoside antibiotic derived from *Streptomyces spectabilis* with bacteriostatic activity. Spectinomycin binds to the bacterial 30S ribosomal subunit. As a result, this agent interferes with the initiation of protein synthesis and with proper protein elongation. This eventually leads to bacterial cell death.
