Potential competing interests: No potential competing interests to declare.

I think this well-prepared contribution, albeit concise, is a much-anticipated commentary in the academic discussion of AI in medical sciences. Let's make it clear: we all must agree AI is here to stay. It can be a good servant, but a poor master. This article is, indeed, drawing our attention to the direction where emotions are yet hidden behind AI applications and AI recommendations to their end users, i.e., medical professionals. In medicine, the role of dentistry is substantial, which is not covered in this article, perhaps surprisingly. In summary, this article is boosting all of us with its core message. Thank you very much!
