**Potential competing interests:** No potential competing interests to declare.

This study presented a stochastic computer analysis of the Gompertz-Makeham mortality law. My major criticism of the paper is that the mortality law, as cast in equation (1) in the paper, is not constrained to be non-negative. Therefore, one may obtain a negative mortality rate, which is nonsensical. Further, the paper is poorly written; the Introduction section contains only one long paragraph, making it difficult to understand the rationale of this study.
