Review of: "Bladder Chemical Carcinogens in the Workplace"

Bogdan Novac¹

1. Urology and Renal Transplantation, Spitalul Clinic Dr. C. I. Parhon, Iasi, Romania

The paper comprehensively addresses a complex but extremely important issue. Carcinogenic factors in urothelial tumors, many of them related to various substances present in work environments, require thorough investigations and must be recognized as occupational risk factors. The paper takes a balanced approach to a complex issue and can serve as a starting point in the challenging effort to precisely identify each substance and its mechanism of action.
