# Spectinomycin Hydrochloride Anhydrous

National Cancer Institute

## Source

National Cancer Institute. *Spectinomycin Hydrochloride Anhydrous*. NCI Thesaurus. Code C90690.

The anhydrous hydrochloride salt form of spectinomycin, an aminocyclitol aminoglycoside antibiotic derived from *Streptomyces spectabilis* with bacteriostatic activity. Spectinomycin binds to the bacterial 30S ribosomal subunit. As a result, this agent interferes with the initiation of protein synthesis and with proper protein elongation. This eventually leads to bacterial cell death.
