Potential competing interests: No potential competing interests to declare.

In the present manuscript, a literature review regarding the nutritional profile, health effects, industrial applications, and the extraction of bioactive compounds is performed.

Overall, the manuscript is concise and well-written. However, the authors fail to stress the novelty of this review. Tomato is a largely studied species, and several recent review papers and book chapters dealing with nutritional properties, bioactive compounds, and health effects have been published. So, although the article contains mostly new papers, it cites several reviews and book chapters, which depicts the lack of novelty.

For this reason, I suggest the rejection of the manuscript.
