The article is interesting. The authors begin the article with a review of the state of the art addressing the use of UAVs in agricultural crop spraying. They later developed a mathematical model for a quadcopter design. Here are some observations that could improve the scientific content of the article:

- 1) The related works are not current; therefore, the presentation of more recent studies is suggested.
- 2) What was the purpose of using wood in the quadcopter structure?
- 3) Part of the text needs a clearer presentation. There are some problems with certain numbers; for example, Figure 5 is not adequately explained, making its meaning unclear.
- 4) What are the possible future improvements mentioned in the article to optimize the effectiveness and stability of the quadcopter for precision crop spraying?
