Potential competing interests: No potential competing interests to declare.

I would like to thank the authors for their study on the in vivo toxicity of *Rhamnus prinoides* roots and *Clematis hirsuta* leaves. This study is intriguing, but I have seen that there are a few criticisms.

1. In the abstract part, please add amounts of significant data results.
2. In the last part of the introduction, it talks about the aim of the work and what exactly you do.
3. In the material and methods parts, you should write the time of extraction, the amounts you get from hot water extract, and the duration of the hot extract. Please rewrite this part well.
4. To confirm the data, please add the histopathological parts to the work.
5. 2. Limited comparison with prior research: It would be beneficial to offer a more thorough analysis of the existing literature and how the results of the current study relate to earlier studies on toxicity and safety in order to deepen the discussion.
