The authors have presented a rare case of DIC due to clear cell carcinoma of the ovary. The manuscript has been written very well. My comments are as follows:

1. I suggest the authors to mention why bilateral salphino-oophorectomy was done in a young lady when the disease was only on right side.
2. What happened to CA-125 levels after surgery and during adjuvant therapy?
3. The Discussion section is short. Please discuss about how to make preoperative diagnosis and treatment of ovarian clear cell carcinoma.
4. Which is the commonest type of ovarian cancer associated with DIC?
