Potential competing interests: No potential competing interests to declare.

In my opinion, the paper is well-organized and presented in a clear and accessible manner. However, the quality of the mathematical writing leaves much to be desired. For instance:

- 1) Until which index k should we consider, instead of $(k = 1, 2, 3, \dots)$?
- 2) Please ensure that relationships (20) and (21) are fully completed.

This work proposes a new two-point Taylor formula,

taking into consideration the fact that this topic is very interesting and important in various branches of mathematics. But what drives the necessity behind conducting the 2-point series expansion?
