

Review of: "An accuracy test of Altman and Zmijewski accounting-based bankruptcy models"

Giovanni De Luca

Potential competing interests: No potential competing interests to declare.

The article is a comparison between two methods for forecasting bankruptcy: the Altman score and Zmijewski bankruptcy probability.

The data comes from Portuguese companies with more than 10 workers and 1 million euros in assets from 2016 to 2021 (banks and insurance companies are excluded).

Did you consider all the companies with the mentioned features (more than 10 workers and 1 million euros in assets from 2016 to 2021), or a sample?

The estimates can be read in Equations (1) and (2). Can you show the standard errors of the estimates?
