I appreciate the authors who have put their academic efforts in doing this research and writing manuscript. Overall subsections of the article are written in sequence following guidelines. I have few comments/suggestions:

1. Authors have to self review the language of article and improve it.
2. Authors have written mean with standard deviation like 4.08 (1.147) but it is usually written as 4.08 ± 1.147. They may think on it
3. In sample size authors have mentioned "Stratified random sampling was used". It's better if they describe it.
4. In results , they have written **Academic grade (Points); it's better if they document Source of academic grade point.**
5. Authors may have to write limitations of their study.
