Potential competing interests: No potential competing interests to declare.

The abstract does touch upon some themes that are reiterated in the final considerations, such as the importance of vegetation recovery along watercourses, the lack of awareness about the benefits of riparian vegetation, and the need for community involvement in conservation efforts. However, the abstract primarily focuses on describing the study objectives and methodology, while the final considerations delve deeper into the socio-environmental complexities of the restoration project and emphasize the importance of collective action and government involvement. Therefore, while there is some correspondence between the abstract and the final considerations, the latter provides a more comprehensive discussion of the broader implications and outcomes of the study. To ensure alignment between the abstract and final considerations, consider revising the abstract to include key insights and conclusions drawn from the socio-environmental analysis presented in the final considerations section.
