Review of: "Multidimensional Soliton Systems: an Update"

Xuekai Ma¹

1. Universität Paderborn, Germany

The current work is an update of the previous review on multidimensional solitons and contains recently reported notable results on this topic. It also offers a compact outline of the current experimental and theoretical studies. This update is timely and well-organized. I would like to recommend its publication.

One small comment on the formulas: Some of the parameters and variables, such as 't' and 'g' in Eq. (2), should not be bold, as it may indicate vectors. The same applies to the following formulas.

There is another typo in the caption of Figure 1, i.e., the temperature '41 K' with a superscript '41'.
