Review of: "Quantifying Water-Food Nexus (Water Footprint) for Food Crop Production: A Case Study of Addis Ababa City"

Amit Biswas¹

1. Department of Agricultural Engineering, Haldia Institute of Technology, Kolkata, India

1. Introduction is not informative. It should be revised. The introduction should be revised with the exact research gap for that particular study area. Then objectives can be formulated.
2. Materials and methods should have a study area figure. It is missing.
3. The results part is okay. However, a strong discussion part is missing. The results of the present manuscript were not compared properly with previous research. The discussion part should be revised.
4. The conclusion should be short and informative. It is too lengthy.
