Could you describe the method more clearly?

While the proposed framework offers significant advancements in mitigating bias, these drawbacks highlight the need for continuous evaluation, interdisciplinary collaboration, and iterative improvement to ensure practical and ethical deployment in real-world clinical applications.

Add a section discussing the limitations of the datasets used and the ethical implications of using sensitive attributes.

Provide more details on how sensitive attributes were defined and collected in each dataset.

Emphasize the need for clinical validation and discuss the potential impact on human clinicians.

Include a brief discussion of the potential for misuse and the importance of responsible development and deployment.
