Title: Climate Change and Sustainability: A Comparative Case Study

The authors stated that the paper presents a comparative study "examining the approaches to climate change and sustainability in Sweden and India". The paper is a theoretical approach, with many truisms and without any data. As it looks now, the contributions of this paper are elusive, therefore, the paper requires major improvements:

1. The introduction does not cover the state of the art. Please, add more references to better emphasise the context and to point out the research gaps. Make sure you add the contributions of this paper and the original findings.
2. In case study 1-Sweden: please add actual data to support your statements and use national/European databases. Moreover, please make sure you document with suitable, up-to-date data all your statements (please, add up-to-date references). Add data about: actual share of renewable energy, energy policies, public transportation, waste management, recycling & reusing, green initiatives, economic growth, social equity.
3. In case study 2- India: please add actual data to support your statements and use national/Asian databases. Moreover, please make sure you document with suitable, up-to-date information all your statements (please, add up-to-date references). Add data about: economic growth, air pollution, water pollution, CO2 emissions, share of renewable energy, policy initiatives (with clear references about each initiative), investments in green technologies.
4. Make sure you contrast the two countries and point out the lessons which can be learned from Sweden which can be applied to the specificity of India.
5. Please, make sure you cite within the text all the references.

Good luck!
