The paper provides a comprehensive examination of in-vitro antibacterial activity of some Ganoderma Species:, covering a wide range of aspects in impressive detail. I did not identify any grammatical mistakes in the paper. The writing is clear and well-edited. However, it seems like there are two different sections discussing on the antimicrobial properties of Ganoderma which it could be combined into one. The paper also places a clear emphasis on recent literature, which significantly strengthens the relevance and currency of the research.
