Extracellular Matrix Protein Gene

National Cancer Institute

Source

National Cancer Institute. *Extracellular Matrix Protein Gene*. NCI Thesaurus. Code C26000.

Extracellular Matrix Protein Genes encode mostly fibrous Extracellular Matrix Proteins (e.g., Collagen, Elastin, Fibronectins, and Laminin), typically located in the Extracellular Matrix and commonly involved in cell attachment, cell movement, cell growth, morphogenesis, organogenesis, and tissue repair, architecture, and organization. (NCI)
