**Potential competing interests:** No potential competing interests to declare.

The paper aims to perform a literature review regarding the use of Blockchain in electric vehicle payment system.

After careful analysis, I can indicate that the paper needs revision for the following points:

- There is a need to explain in more detail how Blockchain works and especially what the actual benefits of its use in the context of interest may be. The use of examples related to the payment system could be useful to make the reader better understand the reasons for such integration.
- The analysis of scientific literature should be further deepened as 21 articles may be few for the intended goal.
- The inclusion of images and tables to clarify the distribution of articles both in terms of time and topics covered would be helpful.
- The objective of the paper should be better clarified as well as the results obtained. The discussion seems to list the results of other papers but fails to clarify the real contribution of this paper.
