

Review of: "Speed of Gravity: A Simple Experiment to Test the General Relativity Theory"

Elio B. Porcelli

Potential competing interests: No potential competing interests to declare.

I find the author's initiative interesting, but it failed to describe in detail the method of correlating the seismic activities of planet Earth with fluctuations in solar activity.

Assuming that there is indeed a correlation, does the author have any theoretical framework that can describe it?

Without wanting to discourage the author, as it stands I believe the article cannot be published.

I believe that the author should complete the article with more details before publishing it.
