Short stature due to GHSR deficiency

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base*. [Short stature due to GHSR deficiency](#). ORPHA:314811

Short stature due to GHSR deficiency is a rare, genetic, endocrine growth disease, resulting from growth hormone secretagogue receptor (GHSR) deficiency, characterized by postnatal growth delay that results in short stature (less than -2 SD). The pituitary gland is typically without morphological changes, although anterior pituitary gland hypoplasia has been reported.
