Review of: "Online learning during the COVID-19 pandemic, lessons learned and what's next?"

francisco José Ruiz Rey[1]

1 Universidad de Málaga

The article gives a detailed account of all the developments regarding COVID19 in educational settings. The need to abandon face-to-face teaching in educational institutions led us to need e-learning educational platforms in order to be able to continue with the teaching processes. All of this highlighted some deficiencies in the systems, such as connectivity, the digital divide stemming from the social divide, different paces in different countries, a shortage of technological training for teachers, isolation of students, etc. The article, well founded by different authors, analyses all these circumstances and proposes some measures to improve virtual teaching, which has appeared to be integrated in a hybrid way in educational environments, without taking away the necessary protagonism from face-to-face teaching and the figure of the teacher as a facilitator of knowledge. It is a good article that analyses the new educational ecosystem generated by the coronavirus crisis.
