Potential competing interests: No potential competing interests to declare.

I congratulate the authors for their initiative in sharing the project to develop a web-based crime monitoring platform in the city of SAMARA, Ethiopia. Regarding the formal aspects, the paper presented is in the format of a final course work or dissertation. I believe that the authors could encapsulate it in a format such as: Introduction; Materials and Methods; Results; Discussion and Conclusion.

The description of the system is very detailed. However, I believe that the authors could explore other applications related to crime control, such as applications using multi-criteria methods; artificial intelligence; facial recognition using cameras, etc. It would be enriching for the subject to show other perspectives.

I would also suggest expanding the text's references, bringing recent literature on the subject into the discussion.
