- Dear Editor Thank you so much for the invitation to review the manuscript Targeting Cancer Cell Signaling Using Precision Oncology Towards a Holistic Approach to Cancer Therapeutics.
- The manuscript is long and detailed regarding cancer signaling and cancer treatment options, addressing several well-known signaling pathways and their target therapies.
- It looks like a book chapter much more than an article.
- Several improvement options can be suggested to authors, namely, Regarding the form, Figure legend and table titles must be significantly improved. They must describe in detail the Figure once they are autonomous elements of the manuscript, and the reader must be able to interpret the Figure and Legend after reading the Figure Legend.

The subchapters of the manuscript ideally should not have abbreviations.

When using abbreviations, the first time write fully and between brackets the abbreviations, from there on, just use the abbreviations.

Abbreviations do not have plural, please check all manuscript.

Words like *in situ*, *versus* are Latin they must be in italic, please check all manuscript.

when using figures from other papers, please ask for permission, Figures 3 and 4.

Table 2 would benefit if it was organized instead of alphabetic order, by target primary target and organ, and year. would give the readers an insight of the cancer treatment development options.

Conclusions must be improved.

The manuscript would benefit if authors manage to tell a story, making the connection between the different topics addressed.

Conclusions must be improved.
