dear Authers

The title is very good urgent and paramount for the mothers and the health care providers. it is research area. **"Factors Associated with Hospitalization Outcomes for Cases of Anemia in Pregnancy at a Regional Level in Burkina Faso:**

1. the write up is good as to me and the grammatical orchestration. the approach of the study, the authors knowledge regarding the subject matter.
2. but i do have ambiguity on the outcome definition favorable and unfavorable. what i was expecting was list of outcomes on the mother side and the baby side, then operational defining the good and bad outcomes.
3. the method section is good but what I suggest is you know anemia has geographical implications therefore those from highland, mid land and low land are taken as homogenous. just it comments what do think of it? there is need for operational definition of favorable and unfavorable outcomes.
4. is this study considered mother who delivered by CS and SVD together as similar population? as if the study used patient chart to level anemia below 11g/dl?
5. the author has to discuss the study result and give justification and reference for the suggested evidence, for example being rural associated with unfavorable outcome, this result needs discussion and reason.
6. otherwise, your this study is very good study go ahead. population, geographical existence and the service delivered in health facilities with different level, and mode of delivery has to be considered.
