

Review of: "Acacia Pycnantha Gum Exudates Recognised as a Traditional Food in Two Countries May Have Economic Potential"

Ranjan Singh

Potential competing interests: No potential competing interests to declare.

The article entitled Acacia Pycnantha Gum Exudates Recognized as a Traditional Food in Two Countries May Have Economical Potential is an interesting article. The article underlines the natural gum that comes out of the plant. There are different plants that give out gum from the stem, leaves, fruits, flowers, etc. These gums can be used for different purposes both by humans and by animals. Humans eat these gums or can use them in confectionary items, while animals mostly eat them because of the flavor in them. The article is of interest to readers as one can gain good knowledge of the particular subject. The article is very well written with proper figures and references. I accept the article to be published online. I congratulate the author for writing such a wonderful review.

With regards,

Dr. Ranjan Singh,
