HPSE wt Allele

National Cancer Institute

Source

National Cancer Institute. *HPSE wt Allele*. NCI Thesaurus. Code C49414.

Human HPSE wild-type allele is located in the vicinity of 4q21.3 and is approximately 43 kb in length. This allele, which encodes heparanase protein, plays a role in the hydrolysis of heparan sulfate proteoglycans. The HPSE gene is associated with cancer progression and metastasis.
