**Potential competing interests:** No potential competing interests to declare.

The authors present an important review. It is presented qualitatively, however, if it were presented quantitatively, its impact and understanding would be greater.

Climate change studies must present the values or percentages of the variations in concentrations, temperatures, are fundamental for their compression and measures are taken to reduce this negative impact.

When numerical data is presented, the interest and impact is greater in the readers, so it is suggested that the authors include images that allow a quick understanding.
